

ASP.NET MACHINE TEST

Create an Event Management System as per screen shot below.

Event Name

Event Description

Start Date

30/12/2009

End Date

30/12/2009

Organizer

Tickets

Add new ticket

ID	Ticket No	Price		
			Save	
1	00001	22.25	Edit	Delete
2	00004	22.25	Edit	Delete
3	00003	22.25	Edit	Delete
4	0004	3.33	Save	
4	00005	22.25	Edit	Delete

Save Event

It is an Event Management System where one event can have multiple tickets associated with it. On click of "Add new ticket" (validate the 3 fields), an empty row will be appended underneath the ticket heading. One can populate ticket details and on Click of Save, the ticket shall be added here (on the page itself) using jQuery. Then a user can either do an inline edit or can delete the ticket which shall be achieved using jQuery (on the page itself).

On click of "Save Event" (validate the event fields), the event details and the ticket details shall be entered into the database.

No te The task needs to be done using .NET Core 8 or above with Entity Framework Core (Code First with Migrations), Razor Views, and jQuery. The solution must follow Clean Architecture principles with proper separation of concerns and optimized database queries.
